

## APPAREL PROOFER (WASH IN)

Environmentally friendly impregnation spray for outdoor clothing to restore the water repellent effect and breathability.

### How to use:

Shake the bottle

Put 75ml into the softener compartment

Wash according to the manufacturer's instructions. Make sure the item is completely tumble dried and is well puffed as it dries

Using the garment will reduce the DWR. The application revitalizes a garment as close as possible to its original performance. Impregnating is the easiest method as it can be done in the same wash cycle as cleaning. The equipment can be impregnated, heat must then be supplied through a dryer or iron. Our STORM Apparel Proofer does not contain harmful PFCs and offers an excellent level of performance.

### Tip:

To see if an item needs more DWR, drip water onto the surface of the garment. If this stays, the DWR works well, if it sticks to the surface or if it moistens the surface and darkens the color, then it is worth adding a waterproofing spray to the wash cycle. So that the equipment can be impregnated, heat must then be supplied through a dryer or iron.
