

## APPAREL WASH (WASH IN)

Specially detergents for technical outdoor clothing.  
There is a contamination of textiles before the impregnation, without suffering the original treatment of the manufacturing process.  
Restores the water-repellent effect as well as the respiratory effect.

### How to use:

Shake the bottle

Put 75ml into the detergent compartment

Wash according to the manufacturer's instructions

Technical garments have a membrane and DWR coating that ensure that the garment performs at its best and does not absorb water. The DWR performance on the surface can be reduced by dirt, sweat, grease and conventional detergents (containing bleach, color lighteners, enzymes and perfumes). This reduces the garment's breathability and water repellency. Proper cleaning revitalizes the fabric without damaging the active DWR treatment. The STORM Apparel Wash revitalizes the fabric without damaging the active DWR treatment. In order to fully restore the water-repellent effect, it is recommended to include the STORM Apparel Proofer in the wash cycle.
